Leak Check and System Inspections

Accidents may occur if a skilled LP_GAS technician fails to perform a complete system check, from the propane tank to the system pilot orifices. Dean's Bulk Service Inc. must verify the integrity of your propane gas system by conducting a leak check, as defined by the National Fuel Gas Code, and documenting the results. The following situations call for a system inspection and leak check:

- New system of new customer
- Occupancy change
- System interruption (making repairs of modifications, changing regulators, turning off the gas, etc.) including "Out of Gas" situations.
- Suspected gas leak

Dean's Bulk Service Inc. does not charge for conducting a leak check under these circumstances:

1. New Customer (new tank setting, new system)
2. New tank setting, existing system
3. Scheduled Delivery Customer (random test)
4. Suspected leak on our equipment
5. Out of gas – scheduled delivery customer

If we supply you on a "will call" or COD basis, and you run out of gas, a leak check will be performed before refilling, and a fee charged to you based on the current leak check fee schedule.

Dean's Bulk Service Inc. personnel will make necessary repairs to the system from the storage tank to the second stage regulator. You assume responsibility for any damages to said equipment arising from your negligence, carelessness, or abuse. Repairs from the second state regulator to appliances will be your responsibility and you will need to contact a qualified service provider for your repairs.

For will call and COD accts: **Cash or check due upon completion of services.**
All other: **Charges will be applied to current account.**
